Acknowledgments

The Palestinian Central Bureau of Statistics (PCBS) extends its gratitude to all the Palestinian households that contributed to the success of the Violence Survey in the Palestinian Society 2019 through their cooperation in providing the required information. PCBS also thanks all the employees who worked on this survey and showed exceptional keenness to carry out their duties and complete dedication throughout the survey’s various phases. Our appreciation is also extended to the members of the National Advisory Committee for the Violence Survey in their personal and legal capacities, especially Ms. Asmahan Wadi and Dr. Mohammed Al Haj Yahya for their exceptional efforts and for following up the survey’s planning and implementation phases.

The Violence Survey in the Palestinian Society 2019 was planned and conducted with the leadership of a technical team formed by PCBS and with funding from its partners at the Ministry of Women’s Affairs, the United Nations Population Fund’s (UNFPA) Haya Programme funded by the Canadian government, the Italian Agency for Development Cooperation, and the United Nations Economic and Social Commission for Western Asia (ESCWA). PCBS extends its warmest thanks and appreciation to them all for their invaluable contribution to this survey’s implementation.

Introduction

The Violence Survey in the Palestinian Society 2019 is a specialized valuable survey which was implemented in Palestine for the third time. The first survey was conducted in the year 2005 and the second followed in 2011. The survey is of great importance as it sheds light on the phenomenon of violence in the Palestinian society including all its types such as violence occurring within households and communities. The current version provides an opportunity to compare its findings with those of previous versions to observe the change in size of this deep-rooted phenomenon in the Palestinian society, its abundance, changes in trends, and related developmental and humanitarian characteristics. The survey’s current version aims at providing a comprehensive and updated database on violence targeting women, children, the youth, the elderly and persons with disabilities. Such a database may help decision and policy makers to prepare plans and programs and to design evidence-based interventions to uplift these marginalized social sectors, meet their needs and provide them with much needed services.

The Violence Survey in the Palestinian Society 2019 was conducted in light of the increasing need to fill the data gaps present in the two previous surveys. It also comes in response to international demands related to the sustainable development agenda 2030 and in response to the need to provide these indicators to realize national priorities. The survey also meets the needs of all partners including governmental and nongovernmental organizations and civil society institutions, especially the National Committee to Combat Violence against Women, which is headed by the Ministry of Women’s Affairs in the aim of helping it to prepare the forthcoming National Strategy to Combat Violence against women. The survey also aims at developing a special department that provides data to be introduced to a model for measuring economic costs for the Ministry of Women’s Affairs.

The changes and additions provided by the current survey have been reflected by the changes in the applied methodology which took into consideration maintaining the ability to draw comparisons between its findings and those of the 2011 survey. It also added indicators that were not present in the past such as the Cyber violence indicators. Data collection tools have also been developed through the use of modern technology such as tablet devices and the GPS navigation system. Answer cards were also used to help respondents select answers without the need to disclose their views. This maintained the confidentiality needed by the survey’s sensitivity. A data collection method was also developed to take some of the load off the households and increase response rates; therefore, shaping one of the best practices which PCBS seeks to continuously upgrade.

At the national level, the survey was conducted on the basis of real partnership and coordination between all parties. This was embodied through the formation of a national advisory committee led by both PCBS and the Ministry of Women’s Affairs with the membership of a number of public institutions, NGOs, civil society organizations and some international organizations and institutions. This committee constituted a national reference for this survey to ensure that all the partners’ needs were met.

We at PCBS hope that this survey has provided essential information to help decision makers to follow up and evaluate policies related to violence in the Palestinian society and to enable policy experts to analyze the information to be able to follow up and evaluate programs and policies related to violence throughout Palestine.

Aggressor/Ranter:
Any person who practices violence in all its types.

1.2 Classification
The statistical data collection and processing processes were based on approved classifications used by PCBS in accordance with international standards and which were suitable for Palestinian specificities as mentioned in the Palestinian Standard Classification Guide (ISCO-08).
Chapter Two

Main Findings
Main Findings

This chapter presents a summary of the key results of the Violence in the Palestinian Society Survey 2019. The findings shed light on the violence experienced by individuals in the Palestinian society, whether it is a household or society violence. The summary offers a reading on the status, direction and size of the violence phenomenon in Palestine.

This survey has measured various types of violence it has also studied the locations in which individuals have experienced violence of all types such as violence on the street, in public transportation, shopping venues, educational institutions, workplaces and households. It has also studied the types of violence such as psychological, physical, sexual, social, economic and cyber violence experienced by all groups of individuals including currently married or ever married women of the age group (18-64 years), children below 18 years of age, currently married or ever married men of the age group (18-64 years), who have never been married individuals of the age group (18-64 years), elderly persons aged 65 years or above and persons with disabilities.

2.1 Violence in public areas

1. Violence in shopping places

- **4%** West Bank
- **6%** Gaza Strip
- **10%** of the youth have experienced psychological violence in shopping places (inside markets or shopping stores) by others
- **5%** of male children aged (12-17 years) experienced violence in shopping places
- **2%** West Bank
- **7%** Gaza Strip
- **6%** of currently married or ever married women aged (18-64 years) have experienced psychological violence in shopping places
2. Violence on the street

- 4% of currently married or ever married women aged (18-64 years) experienced psychological violence on the street by others in Palestine and in each of the West Bank and Gaza Strip.

- 12% of currently married or ever married men aged (18-64 years) experienced psychological violence on the street by others in Palestine.

- 21% of the male youth in Palestine aged (18-29 years) who have never been married experienced psychological violence on the street.

- 24% of children aged (12-17 years) in Palestine experienced violence on the street.

Throughout the 12 months preceding the interviews 2019.

West Bank

Gaza Strip
Main Findings

3. Violence in educational institutions

- **4%** of the youth aged (18-29 years) experienced psychological violence inside educational institutions (universities or colleges) in Palestine.

- **25%** of children aged (12-17 years) in Palestine experienced a form of violence at school.
  - **15%** in West Bank
  - **19%** in Gaza Strip
  - **25%** overall

- **17%** of children aged (12-17 years) experienced physical violence by a male or female teacher in Palestine.
  - **7%** in West Bank
  - **10%** in Gaza Strip
  - **26%** overall

- **15%** of children aged (12-17 years) experienced psychological violence in Palestine by a male or female teacher.
  - **12%** in West Bank
  - **10%** in Gaza Strip
  - **18%** overall

Throughout the 12 months preceding the interviews 2019.
4. Violence at the workplace

Throughout the 12 months preceding the interviews 2019

- **8%** of the currently married or ever married working men aged (18-64 years) experienced **psychological violence** at the workplace in Palestine
  - **12%** Gaza Strip
  - **6%** West Bank

- **2%** of the currently married or ever married working women (18-64 years) experienced **psychological violence** at the workplace in Palestine

- **10%** of the working male youth who have never been married aged (18-29 years) experienced **psychological violence** in Palestine
  - **13%** Gaza Strip
  - **8%** West Bank
2.2 Violence against currently married or ever married women (18-64) years

1. Psychological violence is the most abundant type of violence practiced against women.

Percentage of currently married or ever married women (18-64 years) who experienced (at least once) a form of violence by their husbands throughout the 12 months preceding the interview by region and type of violence for 2019

4. More than a third of the male and female youth who have never been married and experienced violence by a household member are aware of the existence of centers or institutions providing protection against violence in the region, locality or governorate in which they live

36%

5. Youth who have been experienced sexual violence or harassment during childhood

According to the measurements of the indicators of 2030 sustainable development goals and in compliance with the indicator (SDGs 16.2.3)

3% of the youth (18-29 years) reported that they experienced sexual violence or sexual harassment when they were below the age of 18 years

4% 2%
6. Around one third of persons with disabilities (18-64 years) who have never been married experienced psychological violence in Palestine.

- 31% of persons with disabilities who have never been married experienced psychological violence “at least once” from a household member.
- 19% of persons with disabilities who have never been married experienced physical violence “at least once” from a household member.

### 2.4 Violence against children

1. Male children within the age group 11 years and less are the mostly exposed group to violence by their caregivers.

- 74% of children aged 11 years and less experienced psychological violence in the form of (shouting, screaming or being called dumb or lazy or any other similar names) according to the statements of their caregivers.
- 79% of children aged 11 years and less experienced physical violence in the form of (shaking hardly, hitting the back of the hand or any other part of the body with a belt or stick, or hitting hands and legs) according to the statements of their caregivers.

Overall:
- 62% of children aged 11 years and less experienced psychological violence in the form of (shouting, screaming or being called dumb or lazy or any other similar names) according to the statements of their caregivers.
- 68% of children aged 11 years and less experienced physical violence in the form of (shaking hardly, hitting the back of the hand or any other part of the body with a belt or stick, or hitting hands and legs) according to the statements of their caregivers.
Percentage of children aged 11 years and less who experienced violence by their caregivers by type of violence and region during the 12 months preceding the interview, 2019

2. Mothers and fathers violent behaviors towards children (12-17 years)
Percentage of children (12-17 years) who experienced a type of violence by either parent at least once throughout the 12 months preceding the interviews by region and abuser, 2011, 2019

| Region       | Prevalence of Violence | Father | | | Mother | |
|--------------|------------------------|--------|-------------------------|-------------------|-------------------|-------------------|-------------------|
|              |                        | Psychological violence | Physical violence | Psychological violence | Physical violence | Psychological violence | Physical violence |
| Palestine    | 51.0% | 44.2% | 69.0% | 63.1% | 34.4% | 26.3% | 66.4% | 62.7% | 34.5% | 24.8% |
| West Bank    | 45.8% | 36.1% | 64.6% | 54.4% | 28.7% | 15.5% | 61.9% | 56.8% | 27.7% | 17.7% |
| Gaza Strip   | 59.4% | 55.9% | 75.9% | 75.7% | 43.2% | 41.9% | 73.3% | 71.1% | 45.2% | 35.0% |

Main Findings

- The percentage of children who experienced psychological violence by their mother decreased in Palestine from 66% in 2011 to 63% in 2019.
- The percentage of children who experienced physical violence by their mother decreased in West Bank from 62% in 2011 to 57% in 2019.
- The percentage of children who experienced physical violence by their mother decreased in Gaza Strip from 73% in 2011 to 71% in 2019.
3. Around two thirds of children (12-17 years) have sought help from their fathers or mothers.

Percentage of children (12-17 years) who experienced violence by a household member or a relative and sought help by the party approached and region throughout the 12 months preceding the interviews, 2019

2.5 Abuse experienced by the elderly (65 years and above)

1. Elderly women are exposed to abuse more than elderly men in Palestine

- Of the elderly (65 years and above) in Palestine, 8% experienced one type of abuse by a household member (whether they were living with the household or not).

- Medical negligence was the highest form of abuse experienced by the elderly, occurring in 22% of cases.

- 19% of elderly women experienced abuse compared to 16% of elderly men.

(-) means that wives were not asked about sexual violence practiced by them against their husbands during the 2011 survey.
Cyber violence in the form of threats, manipulation, abuse and harassment through the use of social media is a new form of violence experienced by individuals of all age groups in the Palestinian society due to the widespread use of the Internet. This necessitated measuring Cyber violence in the Violence Survey in the Palestinian Society 2019. The main findings were as follows:

1. **8%** of currently married or ever married women (18-64 years) experienced a type of Cyber violence by others through their use of social media networks.

2. **10%** of the youth (18-29 years) who have never been married experienced a type of Cyber violence by others through their use of social media networks.
3. 7% of currently married or ever married men (18-64 years) experienced at least one type of Cyber violence by others through their use of social media networks.

4. 9% of children (12-17 years) experienced a form of Cyber violence by others through their use of social media networks.

Main Findings
3.1 Introduction

The Palestinian Central Bureau of Statistics (PCBS) conducted a specialized national survey on violence in the Palestinian society. This survey is the third of its type conducted at the national level and aimed at studying this phenomenon experienced by individuals both within and outside households structures. The survey was conducted on a households sample of (12,942) Palestinian households during the second quarter of the year 2019. The importance of the survey lies in the recent and comprehensive data it provides on the subject, therefore, assisting in filling a shortage in such data and allowing researchers and planners to prepare studies and set programs and policies aiming at placing a limit to violence practiced against women, men, youth, children and the elderly.

3.2 Objectives of the Survey

To provide comprehensive and representative statistics on violence in the Palestinian society, especially among the following groups: married or ever married women aged (18-64) years, married or who have been married men aged (18-64) years, who have never been married male and female individuals aged (18-64) years, children aged (12-17) years, and elderly persons aged 65 years and above.

In more detail, the survey aims at providing the following data:
• Psychological, physical, sexual, social and economic violenc experienced by women who are currently married or ever married in the past by their husbands.
• Psychological, physical and sexual violence experienced by children aged (0-11) years from the perspective of their caregivers.
• Psychological, physical, sexual, social and economic violence experienced by husbands by the point of view of their wives.
• Psychological, physical and sexual violence experienced by men who have been married in the past by other individuals.
• Psychological, physical and sexual violence experienced by children aged (12-17) years.
• Psychological, physical, social and economic abuse and medical negligence experienced by the elderly (65 years and above).
• Psychological, physical, sexual, social and economic violenc experienced by who have never been married individuals aged (18-64) years.
• The demographic and economic characteristics of individuals experiencing violence.
• Psychological, physical and sexual violence carried out by other individuals.
• Services received by individuals who have experienced violence.
• Cyber violence and its types experienced by all groups.
• Violence against persons with disabilities.
• Related sustainable development indicators (SDG’s).
3.3 The Questionnaire

International recommendations and standards on the area of violence statistics were viewed during the first stages of developing the questionnaire. The experiences of other countries in conducting such surveys were also reviewed while taking into consideration special Palestinian specificities while applying this survey. The questionnaire was designed with reliance on PCBS’s second experience in conducting a violence survey during the year 2011.

The questionnaire for the 2019 Violence Survey was developed in cooperation with our partners in the National Advisory Committee for the Violence Survey and with the help of several experts. Many observations provided by experienced figures were applied reflecting a purely Palestinian experience. The importance of the survey also stemmed from the urgent need of the local community for the indicators it provides.

The questionnaire consisted of eight main sections as follows:

- **Identification data and Quality Control**: It was asked to any member of a households aged 18 years or more. This section covered all households members in the sample without exception.

- **Housing Conditions**: It was asked to any member of the households aged 18 years or more with the aim of identifying the conditions of the households’s shelter, financial conditions, income, financial needs and spending capabilities.

- **Currently married or ever married women aged (18-64) years**: This section was asked to any woman who is currently married or has been married in the past by selecting one woman from the households (should there be several women) through using the Kish Selection Method. Were there to be more than one disabled woman in the households, women with disability completed separate questionnaires and were registered separately.

- **Children aged (0-11) years**: A male or female child was selected from a households holding an even number. Questions concerning this age group were answered by women who are currently married or have been married in the past and who are the mothers or caregivers of those children. This included children with disability.

- **Currently married or ever married men aged (18-64) years**: This section was asked to any man who is currently married or has been married in the past by selecting one man from the households (should there be several men) by using the Kish Selection Method. Were there to be more than one man with disability in the households belonging to this group, men with disability completed separate questionnaires and were registered separately.

- **Individuals aged (18-64) years who have never been married**: This section was asked to any individual who had never been married, male or female, by selecting him or her from the households. Were there to be more than one individual belonging to this group, the Kish Selection Method was used to select the sample as in the above-mentioned method. Were there to be more than one individual (male or female) with disability, each filled in a separate questionnaire and they were all registered.

- **Children aged (12-17) years**: This section was asked to the children directly whether they were males or females. Were there to be more than one child of this age group in the households, the Kish Selection Method was used to select a child by using the same above-mentioned
methodology to select the sample. Were there to be more than one child with a disability (whether male or female), each was provided with a separate questionnaire and they were all registered.

- **Elderly Persons aged (65 years and above)**: This section was assigned especially to the elderly, whether males or females. Were there to be more than one elderly person in the households aged (65 years and above), all of them were interviewed.

### 3.4 Fieldwork Operations

#### Sample Size
A total of 12,942 sample households were reached out of which 11,545 households responded to the survey. They are divided into 7,913 households in the West Bank and 3,632 households in Gaza Strip.

#### Training
The training course for the Violence Survey in the Palestinian Society commenced in Gaza Strip on Sunday 17/02/2019 and continued for 8 days ending on Tuesday 26/02/2019. In the West Bank, it commenced on Sunday 03/03/2019 and continued for 9 days until 13/03/2019. The total number of trainees in Gaza Strip was 74 and in the West Bank it was 173.

#### Data Collection
The data collection process in the West Bank initiated on 19/03/2019 and was finished on 16/05/2019. In Gaza Strip, the process initiated on 13/03/2019 and was finished on 20/05/2019.

### 3.5 Data Processing

The questionnaire was programmed onto the tablet devices to collect and store data, therefore, shortcutting several phases as data was collected, checked and entered in one phase. This technology requires a high level of skill when using the tablet devices and also requires an accurate understanding of the questionnaire to know all available options that may help in obtaining correct and accurate data from the source. These tablets were used to collect data in Gaza Strip and the West Bank, excluding Jerusalem (J1) while used in paper forms.

In the second phase, the data cleaning was completed through internal checks on out-of-range responses and comprehensive in which extensive review based was constructed through the use of SPSS, where clean and accurate data was prepared. This is followed by the data tabulation and results extraction process.
Chapter Four

The Quality
The Quality

This chapter addresses the evaluation of the survey’s data quality by presenting the mechanisms that ensure accuracy data and those that limit potential errors, whether sampling or non-sampling ones.

4.1 Accuracy

Data accuracy checks include several aspects of the survey such as sampling and non-sampling errors caused by the staff and survey tools, as well as survey response rates and their effect on estimations. This section includes the following:

4.2 Sampling Errors

This survey’s data was affected by sampling errors, which resulted from sample study of the society and non complete enumeration. Whereas the Violence Survey in the Palestinian Society 2019 was conducted on a sample, sampling errors were inevitable. To reduce sampling errors, a probability sample suitably designed to calculate errors had to be used continuously. This implied that each unit in society had an opportunity to be selected in the sample. Variance and the effect of the sample design have been calculated for the main indicators at the level of Palestine, the West Bank and the Gaza Strip.

Variance Calculation Summary for the main Survey Indicators

The percentages of currently married or ever married women aged (18-64 years) who experienced certain types of violence by their husbands throughout the past 12 months according to types of violence in Palestine

</tbody>
</table>
4.3 Non-Sampling Errors

Non-sampling errors are possible at all stages of the project during data collection or processing. They can be summed up as non-responsive errors, response errors, interviewing errors and data entry errors. To avoid errors and reduce their effects, large efforts were exerted through the intensive training of field workers on methods of interviewing, and the points to be followed and others to be avoided during interviews. Also, some practical and theoretical exercises were provided during the training course. Non-sampling errors in this survey resulted from its special status and the large number of households considering that it intervened in the most specific details of their personal lives. This resulted in some cases of rejection to cooperate which were dealt with through persuasion methods to minimize rejection cases as much as possible.

4.4 Response Rate

The survey sample consists of about 12,942 households of which 11,545 households completed the interview; whereas 7,913 households in the West Bank and 3,632 households in Gaza Strip. Weights were modified to account for non-response rate.

**Response and non response equations:**

\[
\text{Percentage of over coverage error} = \frac{\text{Total cases of over coverage}}{\text{No. of cases in original sample}} \times 100\% = 3.2\%
\]

\[
\text{Non-response rate} = \frac{\text{Total cases of non-response}}{\text{Net sample}} \times 100\% = 7.8\%
\]

Net sample = original sample – (cases of over coverage) = 12,527

Response rate = 100% - rate of non-response = 92.2%

4.5 Comparability

This section is related to the statistical product as statistics must be able to be compared with other sources and other time spans as many analyses are based on comparison. The data and indicators of the survey 2019 to those of previous years. Also, to evaluate data, the internal consistency of the data was measured to ensure its logicality and completeness. Test results revealed the presence of internal consistency between all data.
